Games – Exercises (All Answers)

Exercises for Chapter 7 of Steinhart, E. (2017) *More Precisely: The Math You Need to Do Philosophy*. Broadview Press. Copyright (C) 2017 Eric Steinhart. Non-commercial educational use encouraged! All others uses prohibited. (Version 1)

1. Matched Pennies

Alice and Bob each have a big bag of pennies. They are standing on opposite sides of a table. They play a game. On each round of the game, each puts a penny down on the table at the same time. Neither player can see the other's penny in advance. Their strategies could be random or defined by some rule. After they put their pennies down, they look at the pennies. If both pennies show the same side (both heads, or both tails), then Alice gets both pennies. But if the pennies show different sides, then Bob gets both pennies. They can play as many rounds as they like. Draw the payoff matrix.

2. Goalie & Kicker

A soccer goalie faces a kicker. A referree will blow a whistle, at which point the kicker kicks and the goalie jumps. They move at the same time. The kicker can kick the ball to his right or left; the goalie can jump to his right or left. Note that, since they face each other, the directions of their bodies are opposites. If the kicker kicks to his right and the goalie moves to his right, then they will have moved in opposite directions. Thus a goal will be scored. If a goal is scored, the kicker gets 1 and the goalie 0. But if the goalie blocks the kick, then the goalie gets 1 and the kicker gets 0. Draw the payoff matrix.

3. Battle of the Sexes

Ashley and Bailey are in love! They need to coordinate for their date tonight. Ashley would prefer to go to a movie, while Bailey would prefer to go to the opera. Tragically, they've lost their phones, and they have no way to communicate. All either one can do is show up at some place: each can go to either the movie theatre or to the opera house. If either gets their preference, that's a payoff of 2; if they don't get their preference, they get a payoff of only 1. But love is the most important thing! If they don't spend the evening together, their payoff is each 0. Draw the payoff matrix.

4. Chicken

Ali and Blue are racing towards each other in cars down a one-lane road. But up ahead, at the place where their paths converge, the road briefly widens out to two lanes. At that place, each must swerve either left or right. If they collide, the payoff is -10 for each. If they miss each other, it's 0 for each. Draw the payoff matrix.

5. Stag Hunt

Show that there is no strictly dominant strategy in the Stag Hunt. Since the payoff matrix is symmetrical, the calculation only needs to be done for player A. To show the failure of strict dominance, show both that Stag_A *does not* strictly dominate Hare_A and that Hare_A *does not* strictly dominate Stag_A .

Stag_A strictly dominates Hare_A

Hare_A strictly dominates Stag_A

6. Farmers and their Crops

Two farmers control the local wheat market – they grow all the wheat in the area. After the harvest, each independently sets a price for their wheat. The price is either Low or High. where each can offer to sell High or Low. The payoff matrix is shown below.

\mathbf{i}		Farmer Bob			
	\searrow	Lo	W	Hi	gh 🛛
er Alice	Low	1	1	4	0
Farme	High	0	4	2	2

Look for a Nash equilibrium by filling in Table 1. For each blank cell in the table, fill in the change in payoff (going up or down or staying the same), and state whether person in the column will change their strategy.

Choice	Choice	Ask Alice	Ask Bob
of Alice	of Bob	about changing	about changing
High	High		
Iliah	Low		
nigii	LOW		
Low	High		
T	T		
Low	Low		

Table 1. Nash e	quilibrium in the	Wheat Market?
-----------------	-------------------	---------------

Is there a Nash equilibrium?

If so, what is it?

7. Prisonner's Dilemma – Nash Equilibrium

Below is the payoff matrix for the Prisonner's Dilemma.

\mathbf{i}			Bob		
\backslash		Cooperate		Defect	
an	Cooperate	-2	-2	-6	0
A	Defect	0	-6	-4	-4

Look for a Nash equilibrium by filling in Table 2. For each blank cell in the table, fill in the change in payoff (going up or down or staying the same), and state whether person in the column will change their strategy.

Choice	Choice	Ask Allan	Ask Bob
of Allan	of Bob	about changing	about changing
Соор	Соор		
Соор	Defect		
Defect	Coop		
Defect	Defect		

Table 2. Nash equilibrium in the Prisonner's Dilemma?

Is there a Nash equilibrium?

If so, what is it?
